UTILITY INVENTION DESCRIPTION

The invention is understood to relate generally to manufacturers interested in a powder dispenser attachment on a vacuum cleaner. More specifically, the invention itself is a vacuum cleaner attachment that includes a powder or liquid dispenser, which releases a carpet freshener onto a carpet surface. The carpet freshener is released by pushing a button or pulling a chain that is mounted along side the vacuum cleaner while a user operates the vacuum cleaner.

The pushing of a button or pulling of a chain can also be replaced with an open and closed shutter door. The shutter door will have a lever that controls the cannister part of the attachment. This lever will operate the switch that will release the carpet freshener amount. The levels will regulate the flow and the amount of carpet freshener being released as the vacuum is being pushed. It will have three levels: low, medium or high flows. The switch will thus control the amount and time of dispensing while the vacuum is in operation.
